

FirstLook

FirstLook is an image search engine that gives the user the ability to filter results based on copyright status such as public domain or creative commons licenses. There would also be the ability to immediately contact a publisher/creator directly from the image the user would like to use to ask for rights, etc instead of having to reverse image search as is a common issue at the moment.

I want to create a clean, easy to navigate site. I will include an about page, a page explaining how copyright works, and resources -- along with the home page. The coding of the actual search engine itself is likely out of my league, not to mention I don't have a large image database myself, but I figure I can create every other aspect of the site.

Other sites I looked at for inspiration:

- <https://creativecommons.org/>
- <https://symbolset.com/>
- <https://escapecommittee.com/>

Comparable businesses:

- <https://creativecommons.org/>
- <https://www.google.com/>
- <https://www.flickr.com/>
- <https://pixabay.com/>
